Id7160

Ig gamma 2b chain constant region - pig (fragment)

C;Species: Sus scrofa domestica (domestic pig)

C;Date: 21-Feb-1997 #sequence_revision 21-Feb-1997 #text_change 21-Jan-2000

C;Accession: Id7160

R;Kacskovics, I.; Sun, J.; Butler, J.E.

J. Immunol. 153, 3565-3573, 1994

A;Title: Five putative subclasses of swine IgG identified from the cDNA sequences of A;Reference number: Id7158; MUID:95015845

A;Accession: Id7160
                                                                                                                                                                                                                                                                                                                                                                                            A;Status: preliminary; translated from GB/EMBL/DDBJ

A.Title: Sequence has the full allotypic marker, 104-Met, and the e15 allotypic marker allother: A116, 249-259, 1970
A.Title: Sequence studies of the FG section of the heavy chain of rabbit immunoglobulin A.Reference number: A90245; MUID: 70110015
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A; Molecule type: protein
A; Molecule type: protein
A; Molecule type: 129-131; 155-172, 'D', 174-184, 'A', 186, 'E', 188-200, 'D', 202-217, 'E', 219-232, 'Q', A; Molec: this has the e15 allotypic marker, 185-Ala
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into la C; Superfamally: immunoglobulin C region; immunoglobulin homology
C; Reywords: duplication; glycoprotein; heterotetramer; immunoglobulin
E; 20-82/Domain; immunoglobulin homology < IMI>

                                                                                                                  The sequence is that of fusion protein TNFRFc comprising the extracellular domain of tumour necrosis factor (TNF) fused via a hinge region to the Fc part of the heavy chain of human 1gGl. It may be used as part of a cell free receptor binding test which can be used for the identification of agonists, antagonists, antibodies, biological activity of soluble cellular receptors, functional analysis of modified ligands and diagnostic or therapeutic substances.

O45224 is cDNA from clone 1 of library WI-26 VA4 of human fibroblast cell line WI-26 VA4. The mature full-length TNFRI is a glycoprotein waving a mol. wt. of about 75-80 kDa. The cloning of the cDNA for TNFRI was described in Smith et al., Science 248:1019,1990. Clone 1 is contained in expression vector pCAV/NOT-TNFR (ATCC 68088). A crecombinant chinaric antibody may be produced having TNFR sequences substituted for the variable domains of either or both of the immunoglobulin molecule heavy and light chains and having missing control in given in Q45225/R51003. The run TNFR: C fusion gene was created by ligating the following fragments into a cloning vector: 1) an 867 bp Asp718-Pvuz fragment from pCAV/NOT-TNFR (ATCC 68088) contg. the cDNA encoding the truncated TNFR. 2) a 700 bp Styl-Spel fragment from plasmid pIXX498 coding for 232 AAs of the CTC for ontg. the Fc fragment of human 1gGl. Plasmid pIXX498 is a yeast expression vector contg. the Fc fragment of human 1gGl. Plasmid pLiner Q45226, which encodes the 3' end of the truncated TNFR with the human 1gGl. S) and oligo linker, to finse the truncated TNFR with the human 1gGl. S) and oligo linker, c inker was created by PCR using primer Q45226, which encodes the 3' end of thuman 1gGl.

C 57-237 of human 1gGl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             247
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   196

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  region. The invention provides the use of Fas antagonist as an agent for the treatment and prevention of apoptosis-related diseases. The Fas antagonist can be a partial Fas antigen peptide containing the extracellular part of the protein, but lacking the signal sequence, an anti-Fas antibody, or an anti-Fas ligand antibody, where the antibody is preferably a humanised antibody. The Fas antagonist is used in the treatment and prevention of diseases such as myocardial infarction, heart disease, ischemic restences of the heart, liver or kidney, and endotoxic shock, and also as an organ preservative in transplantation. The agent is of low toxicity but effectively inhibits the Fas/Fas ligand
Fas ligand; Fas antagonist; apoptosis related disease; liver disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This represents the antigenic peptide hFas (nd29) containing the Fc
                                                                                                                                                                                                                                                                                                                                                                heart failure; kidney failure; graft-versus-host disease; antibody; myocardial infarction; ischemic restenosis; endotoxic shock.

                                                                                                                                                                                                                                                                            has low antigenicity, promotes apoptosis and is useful in treatment of viral and other diseases
                                                                  The present sequence is a Fas antigen derivative/IgG1 Fc fusion, which contains a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the 1st cysteine residue (preferably at least 29 residues are deleted).

The derivative is an effective regulator of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, es, diabetes, arthritis, lupus and in particular viral diseases such as hepatitis, influenza and HIV, by modulating apoptosis of virus-infected cells.
                                                                                                                                                                                                                                                                                                                                                VCKRCPDGFFSNETSSKAPCRKHTNCSVFGLLLTQKGNATHDNICSGNSESTQKCGIDVT

                                                                                                                                                                                                                                                                                                                                                                                                                                              This plasmid encodes an OX40/Fc antibody fragment mutein protein, and is used to express a soluble OX40/Fc mutein fusion protein for use in detecting CDNA clones encoding a OX40 ligand. The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EDNA (ATCC CRL 10478) monkey kidney cell line. Culture supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to screen various cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ptqdtvcrcr-----pgtqprqdsgyklgvdcvpcppghfs--pgnnq

The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The thin wentine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.

The present sequence represents a fusion protien of the extracellular domain of a murine polypeptide, which a member of the cell development cycle protein family known as the Dellta family of mammanian membrane surface-bound ligands, and the human immunoglobulin G (IgG) Fc portion. The murine delta-related protein gene is expressed within vascular endothelium indicates a role for the polypeptides in the control of endothelial cell biology. The murine polynucleotide was identified from a white adipose tissue cDNA library. The polypeptide is useful for identifying receptors, which bind to and/or are activated by the polypeptide. The polynucleotide is useful in gene therapy of cerebral autosomal dominant ateriopathy with subcortial infarcts and leucoencephalopathy, an autosomal dominant disorder causing ischemic strokes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cell development cycle protein of delta family useful for treating various disorders associated with central nervous system e.g. cerebral autosomal dominant ateriopathy and ischemic strokes

The present sequence represents human neurturin receptor alpha (NTNR-alpha)/FC sequence (IFF2a) fusion protein, from an example of the present invention. WINR-alpha proteins can be used: (a) to identify conclecules that bind specifically to it (potential agonists and indentify undecules that bind specifically to it (potential agonists and neutrurin (NTN); (c) to increase survival of Ret-expressing cells to neutrurin (NTN); (c) to increase survival of Ret-expressing cells or to activate Ret on the surface of cells (soluble glial derived neurotrophic factor receptor (GDNFR alpha) may be used the same way); (d) to increase the half-life of cognate ligands (especially NTN); (e) diagnostically to determine serum levels of its ligands; and (1) as confinal feed additive or molecular weight marker. NTNR-alpha, its genes, animal feed additive or molecular weight marker. NTNR-alpha, its genes, confinance and its ense nucleic acids, are useful in vivo drex vivo for treating conditions related to abnormal NTN activity or response, particularly neurological (central or enteric), renal or hematopoietic (spleen) diseases or injuries. Ab may be agonists or antagonists for therapeutic use (e.g. as antagonists to treat excessive/unwanted NTNR-appression, e.g. in some tumours), also reagents for imminoassay and affinity purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  542

The present sequence represents rat neurturin receptor alpha

(NTNR-alpha)/Fc sequence (IFF2a) fusion protein, from an example of the

(NTNR-alpha)/Fc sequence (IFF2a) fusion protein, from an example of the

present invention. WTNR-alpha proteins can be used: (a) to identify

compounds that bind specifically to it (potential agonists and

antagonists) and to purify such compounds; (b) to modulate response of

calls to neutrurin (NTN); (c) to increase survival of Ret-expressing

cells or to activate Ret on the surface of cells (soluble glial derived

cells or to activate Ret on the surface of cells (soluble glial derived

controlly to determine serum levels of its ligands; and (f) as

can almal feed additive or molecular weight marker. WTNR-alpha, its genes,

contracting conditions related to abnormal NTN activity or response,

controllarly neurological (central or enteric), renal or haematopoietic

controllarly neurological (central or enteric), renal or haematopoietic

controllarly purification.

conditions antagonists to treat excessive/unwanted NTNR-

alpha expression, e.g. in some tumours), also reagents for immunoassay

Isolated nucleic acid molecule encodes a neurturin receptor-alpha amino acid sequence excluding the N-terminal signal peptide -	PN W09832771-A1. XX PD 30-JUL-1998.
Claim 3; Column 97-102; 78pp; English.	XX PF 29-JAN-1998; 98WO-JP00370.
The present invention describes a neurturin receptor alpha (NTNR alpha). NTNR alpha binds neurturin. The NTNR alpha nucleic acid molecule is useful for the expression of NTNR alpha, which may be used to identify	AA PR 29-AUG-1997; 97JP-0234544. PR 29-JAN-1997; 97JP-0015118. XX

```
This represents an integrin beta-1 chain. The invention provides that integrin-immunoglobulin chimeric protein heterodimer complexes that comprise an integrin alpha or beta chain associated with an immunoglobulin light or heavy chain. These chimeric proteins form beterodimer complexes, in particular with a chimeric protein containing an integrin alpha chain and an immunoglobulin chain with a chimeric protein containing an integrin beta chain and an immunoglobulin chain; the immunoglobulin chain in each case may be a heavy chain, or one of the two may be a light chain. The integrin alpha chain is preferably beta is containing to a labba 2 and the integrin beta chain is preferably beta 1. Animal cells transformed with vectors containing the DNA coding for the above chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proteins can be used in the preparation of the chimeric proteins and their heterodimer complexes. The heterodimer complexes, which are useful for testing potential promoters and inhibitors of the binding of integrins to their ligands, function as blood platelet substitutes and
                                                                                                                                                Integrin-immunoglobulin chimeric protein heterodimer complexes as platelet substitutes - contain the alpha and beta integrin chains associated in stable state and bind to extracellular matrix in the

This sequence is a fusion protein of the rabbit transforming growth factor-beta receptor II (TGF-betaRII) and an antibody Fc region. The encoded protein is an example of a protein of the invention, which are isolated TGF-beta receptor fusion proteins that competitively inhibit binding of TGF-beta to TGF-beta receptor. The fusion protein can be used in a method for lowering the levels of TGF-beta in an individual having arthritis. It can also be used to treat medical conditions such as fibroproliferative disorders. The fibroproliferative disorder is a kidney, intraocular or pulmonary fibrosis, especially selected from alabetic nephropathy, of merulonephritis, proliferative collagen vascular disorders, including systemic sclerosis, to treat collagen vascular disorders, including systemic sclerosis, erythematosus. They can also be administered following coronary erythematosus. They can also be administered following coronary erythematosus. They can also be administered following coronary erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      10;

The fusion protein has higher affinity for TGF-beta than fusion proteins comprising the non-variant form of the receptor. The fusion protein contains soluble TGF-beta receptor constructs that are devoid of a transmembrane region (and are secreted from the cell) but retain the ability to bind TGF-beta. The protein competitively inhibits binding of TGF-beta to cellular receptors and/or forms an inactive complex with TGF-beta the protein is used to reduce levels of TGF-beta, for treatment of arthritic conditions associated with overexpression

collagen vascular disease, e.g. systemic sclerosis, polymyositis, scleroderma, dermatomyositis or systemic lupus erythematosus; and fibrosis associated with restenosis. It is also used for treating wounds, to prevent overproduction of connective tissue and so prevent adhesions or scarring, and to prevent post-radiation fibrosis (by administration to patients about to undergo radiation therapy).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       252

The protein is used in the course of the invention. The specification describes cytokine antagonists comprising only the extracellular domain of the specificity-determining component of the cytokine receptor and the extracellular domain of a signal-transducing component of the cytokine receptor. The cytokine is an interleukin (IL-1, IL-2, IL-3, IL-4, IL-5) or IL-15, gamuna-tinterleukin (IL-1, IL-2, IL-3, IL-4, IL-5), gamuna-interferon or transforming growth factor-beta (TGF-beta). The antagonist is capable of binding the cytokine to form a nonfunctional complex. The compounds have therapeutic activity as cytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             299

```
osteoprotegerin/osteoclastogenesis-inhibitory factor.";
Eur. J. Biochem. 254:685-691(1998).
-!- FUNCTION: MAY REGULATE BONE RESORPTION BY BLOCKING TERMINAL STAGES
OF OSTEOCLAST DIFFERENTATION AND ALLOWING ACCUMULATION OF NEWLY
SYNTHESIZED BONE AND CARTILAGE. MAY INHIBIT. IN VITRO
OSTEOCLASTOGENESIS BY INTERPOTING CELL. 91-0-EBLL SIGNALING BETWEEN
STROMAL CELLS AND OSTEOCLAST PROCENITYORS.
-!- SUBUNIT: HOMODIMER (MAJOR FORM) AND MONOMER (MINOR FORM) (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SIMILARITY).

-!- SUBCELLUIAR LOCATION: EXTRACELLUIAR.
-!- SUBCELLUIAR LOCATION: EXTRACELLUIAR.
-!- TISSUE SPECTIFICITY: EXPRESSED AT HIGHEST LEVELS IN LUNG, HEART,
KIDNEY, PLACENTA, THYROID, SPINAL CORD AND LIVER. ALSO DETECTED IN
A NUMBER OF OTHER HEMATOPOIETIC AND IMMUNE ORGANS. NOT DETECTED IN
THE PARCREAS OR PERIPHERAL BLOOD LYMPHOCYTES.
-!- SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.

Cell 89:309-319(1997).
-!- FUNCTION: MAY REGULATE BONE RESORPTION BY BLOCKING TERMINAL STAGE
OF OSTEOCLAST DIFFERENTIATION AND ALLOWING ACCOMULATION OF NEWLY
SYNTHESIZED BONE AND CARTILAGE. MAY INHIBIT IN VITRO
OSTEOCLASTOGENESIS BY INTERUPTING CELL-TO-CELL SIGNALING BETWEEN
STROMAL CELLS AND OSTEOCLAST PROGENITORS.
                                                                                                                                                                                                                                                                                                                                                                        Suggs S., Boyle W.J.;

C; Complex: An immunoglobulin heterotetramer subunit consists or two incurred than disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into c; superfamily: immunoglobulin c region; immunoglobulin homology C; Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin F; 20-85/Domain: immunoglobulin homology <IM1>
F; 21-26f/Domain: immunoglobulin homology <IM2>
F; 243-310/Domain: immunoglobulin homology <IM3>
F; 27-83,144-204,250-308/Disulfide bonds: #status experimental
F; 103/Disulfide bonds: interchain (to light chain) #status experimental
F; 109,112/Disulfide bonds: interchain (to heavy chain) #status experimental
F; 180/Binding site: carbohydrate (Asn) (covalent) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TCPPCPAPELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVKFNWYVDGVEV 242
